Click2Buy multiproduct popin presentation

Multiproducts popin allows you to associate a popin with several products to a call-to-action.

The buttons on the popin trigger the opening of the Clic2Buy widget for the user to find a retailer.

Implementation of the Click2Buy multiproduct popin on your website

You will be given those elements:

1. A Javascript script
2. One key per popin

To integrate the multiproducts popin :

1. Put the following JavaScript script between the `<head></head>` tags of every page you want to be equipped with the multiproducts popin :

```
<script  
src="https://brands.click2buy.com/popin_implementations/POPIN-SCRIPT.js"></script>
```

2. Put your call-to-action inside the following tag, replacing `KEY` by the proper popin key (sent by your project manager)

```
<div class="C2B_Widget_Key" data-key="KEY"><!-- call-to-action --></div>
```

This is where the button appears 
(for example: "buy now").

Asynchronism

Once your page is loaded, our JavaScript script will automatically call a function to bind our multiproducts popin to your call-to-actions.

Your call-to-actions may not be created at the loading of the page, but dynamically.

(example: dynamic websites generated with JavaScript, product selectors, ...).

In this scenario, our script will not be able to initialize the call-to-actions itself. On top of the previous steps, you will have to manually call the following JavaScript function once the call-to-action is present on the page:

```
c2bPopin.init()
```
